

1 people and confirm that it's dial tone to the NID. But, a
2 lot of times, the test, you just can't tell.

3 MR. WELCH: David or Gloria, do you have any
4 thoughts on that?

5 MS. CALHOUN: With an unbundled loop alone, I
6 think that you have some issues about how you define an
7 unbundled loop and some of the testing capability that is
8 available on that loop that is associated with an integrated
9 exchange service might not be present when the loop is
10 separated from the switch. So, I don't think it's possible
11 to make a categorical statement, but to your question, if I
12 may generally talk about Unbundled Network Elements, Bell
13 South's TAFI system that I described will also handle
14 trouble reports for any Unbundled Network Element that can
15 be identified with a telephone number.

16 So, for example, an unbundled port can be reported
17 through TAFI and appropriate status information can be
18 obtained. A combination of a loop and port that can be
19 identified with the telephone number will also be handled
20 through TAFI, so it is possible for the Bell South system to
21 provide an appropriate level of support for trouble
22 reporting on Unbundled Network Elements, depending on how
23 they're identified.

24 Anything that's not identified with a telephone
25 number generally is associated or identified by a circuit

1 number, and those reports can be handled electronically
2 through the electronic communications gateway or the
3 electronic bonding arrangement that's available for design
4 services.

5 MR. SWAN: I would agree with Bob and Rod both
6 from their response. Bob initially commented at the time
7 that the unbundled loop is placed in service, there's some
8 coordination required and some testing in connection with
9 that to assure that the service is in order.

10 When there is trouble, as Rod indicated, the
11 initial testing should start with the CLEC, and to the
12 extent that that testing suggests there's some difficulty
13 from an ILEC standpoint, of course, we would become involved
14 to support that.

15 MR. WELCH: Gloria, if I could ask you to address
16 this, we've heard a lot about parity over the last two days
17 and how the incumbent will provide the same type of access
18 that they provided themselves to the new entrants. Could
19 you please describe a little bit how your company will
20 insure that there is non-discriminatory access to your
21 repair personnel and assets between your retail unit and
22 your new entrants? Are you recording or evaluating your
23 performance for retail business with what you provide your
24 new entrants, and is that information made available?

25 MS. CALHOUN: Well, there are two parts to your

1 question, and the system part of it is that the system is
2 identical and the system is oblivious to whether a request
3 for repair is originating with a CLEC or with a retail
4 customer. So, in terms of appointment times or handling the
5 -- it's really immaterial how, from whom the trouble report
6 is originating.

7 But, in terms of, to get at the question of how
8 you would measure that and how the trouble is actually
9 handled, assuming that it requires a dispatch. Bell South
10 has contractually agreed to contractual performance
11 measurements.

12 MR. WELCH: David, would you like to say how Bell
13 Atlantic is handling that, as well?

14 MR. SWAN: The process is basically parallel.
15 There is, on a call from an end user, a check that we make
16 initially to see if this is user, non-CLEC is the customer
17 now of a reseller, for example, because some resellers have
18 made it clear that should we receive that call directly,
19 that we should refer it to the reseller.

20 So, in that instance, there is some distinction in
21 the way we handle the initial receipt of the call. But,
22 once the call is received or the trouble is reported, it's
23 just a trouble with the system at that point, and we would
24 manage it and process it the same way. As with Bell South,
25 we have agreed on some going forward reports on a

1 comparative basis, to assure parity.

2 We produced reports on a quarterly basis that
3 would summarize the number of trouble reports, the average
4 time to clear and some measure of average or total network
5 availability, for an individual CLEC, and then for all of
6 the CLECs for whom we're providing service.

7 We also produced a summarization for the same
8 metrics for Bell Atlantic retail customers in total, and
9 then would include a similar analysis for our top three
10 interexchange carriers, in this case AT&T, MCI and Sprint,
11 again on a combined basis, to insure and to allow the CLEC
12 to demonstrate that there's parity across that universe.

13 MR. WELBORN: Richard, I'd like to interject
14 something. I believe that once the trouble reports get into
15 the systems, the prioritization is in concert with the
16 ILECs. However, there are different methods, depending upon
17 the different type of service, of entering trouble reports,
18 such as in Bell South's area, some of our unbundled elements
19 are handled on a telephone call basis. They're referred on
20 a manual basis and then entered into the system. All of
21 that process is on a manual type basis.

22 So, you know, again, we need to take a look at
23 what is mechanized, what is not mechanized, and realizing
24 that there is a requirement to have everything mechanized so
25 that it is handled the same all the way through the process.

1 MR. WELCH: Gloria, go ahead.

2 MS. CALHOUN: Again, I will say that Bell South is
3 prepared to accept electronic trouble reports for any
4 service or element that can be identified with either a
5 telephone number or a circuit number.

6 MR. WELCH: As sort of a follow up to this, if I
7 could ask Gloria and David to comment on it, do the new
8 entrants have the ability to receive automatic notification
9 of repair completion for both Unbundled Network Elements and
10 for resold services, as well as the ability to track the
11 status of those repairs as they're going on? Is that
12 something that your systems offer?

13 MS. CALHOUN: Yes, for Bell South.

14 MR. SWAN: And, yes, for Bell Atlantic. It's a
15 little different depending on the electronic interface
16 employed. With electronic bonding OSI, it's the statusing
17 and the clearance is automatic, but with ECG, a gateway
18 process, there is some requirement that the CLEC query the
19 system to confirm the status update and the clearance time.
20 However, for the clearance of the report, at any time it
21 wants what is cleared through the gateway, they could
22 introduce a direct status that would inform them that the
23 trouble had been cleared. But, the actual information
24 related or describing what caused the problem and how it was
25 cleared, they'd have to access on a query basis.

1 MR. WELCH: Bob and Rod, if I could ask each of
2 you, is this something that you need and what has been your
3 experience with this so far?

4 MR. WELBORN: Richard, I'll take a stab at that.
5 Yes, it is something that we need. It's something right now
6 today in many cases there's no positive notification made
7 when a trouble is clear. It's only whether or not you take
8 the time to search through the system itself and gathered
9 those statuses on your own.

10 There is no proactiveness, and that differs from
11 ILEC to ILEC. Some of them do notify you, such as they have
12 the technician call your, the CLECs repair center, clear it
13 out with the repair center. There are others that refuse to
14 do that, and that it's totally on a passive basis. If you
15 want to go in and see if the trouble was cleared, you can do
16 so.

17 MR. COX: I guess from our point of view now,
18 we're pretty much a manual process with Ameritech, primarily
19 calling back and forth and we have driven the issue pretty
20 hard, especially out of service trouble, clear within 24
21 hours and those kind of things. We get a pretty good
22 response back from them.

23 The GUI that we're getting ready to test will
24 provide that information. We'll be able to go in and see.
25 The problem is, you have to have somebody going in there and

1 scrolling for that information. We want some kind of flag
2 back if we're going to use the GUI that says, you've got
3 something in jeopardy here or it's getting close to the time
4 when it should have been put into place or whatever or
5 fixed.

6 So, that is the problem with the GUI. An online
7 system, you should have some kind of flag that would already
8 come up and give you a red signal or something that's going
9 on there.

10 MR. WELCH: Okay, I think Kalpak has a question.

11 MR. GUDE: This is directed towards both David and
12 Gloria. If a service outage occurs for a CLECs end user, do
13 you require CLEC authorization before a dispatch is made?

14 MS. CALHOUN: I'm not sure I completely understand
15 your question.

16 MR. COX: I think what you're trying to get at, if
17 there is an outage that you're aware of, is there
18 authorization required by the CLEC before you will dispatch
19 service people to address that problem?

20 MR. GUDE: No, no, I'm talking for particular end
21 users.

22 MS. CALHOUN: So, you're saying, for example, if
23 the CLEC end user were to call us directly, would we
24 dispatch without contact of a CLEC?

25 MR. GUDE: I'm saying, well, either in that case

1 or the case that you become aware of it independently and
2 you haven't been notified at that point?

3 MS. CALHOUN: In the case of a CLECs end user
4 calling us directly, we would ask the end user to contact
5 their local service provider and any interaction we have
6 with be with the CLEC, presumably through our electronic
7 interfaces.

8 If, I don't know the answer to your question, but
9 if we became aware of a problem with a particular customer
10 before a CLEC, my initial reaction is that we would probably
11 work with a CLEC and not interact directly with their end
12 user.

13 MR. SWAN: In Bell Atlantic's case, I did much as
14 Bell South's. If the CLEC user calls us direct and this is
15 at the, again, the direction of the CLEC, we would refer the
16 call to the CLEC. If the trouble, once provided to us,
17 either verbally or through one of the electronic interfaces
18 by the CLEC, results in a circumstance where a dispatch is
19 necessary with the CLECs' concurrence, we would dispatch,
20 and that concurrence could be given on a blanket basis for
21 all of the troubles that would result in a dispatch on an
22 individual basis, depending on the relationship that we've
23 negotiated with the CLEC.

24 MR. GUDE: Also, the other question is, have you
25 trained or done other work with your repair personnel, to

1 prepare them for their new roles as wholesale repairers? Is
2 there sort of a different role for them? I think that's
3 sort of a fundamental question for that?

4 MS. CALHOUN: Well, I'm going to have to separate
5 that question into the different types of folks who would be
6 involved in repair. First of all, our Bell South repair
7 attendants would not be, in most cases, dealing directly
8 with a CLEC end user, because of what we just talked about.
9 So, the folks who would actually become involved would be
10 anybody who might need to be dispatched out and those people
11 have been trained on their responsibilities, their
12 obligation to provide non-discriminatory service, their
13 obligation not to interfere in anyway with the CLECs
14 business relationship with their customer.

15 MR. SWAN: In Bell Atlantic's case, again, much as
16 with Bell South, the -- if there is a need to dispatch, of
17 course there would be a Bell Atlantic repair person at the
18 sight of the CLEC end user. Of course, we spent some time
19 with our repair folks to prepare them for that circumstance.
20 We have also worked with the group of CLECs who are our
21 customers, on leave behind material or collateral that may
22 be necessary to show, confirm that we're there on behalf of,
23 and although we're a Bell Atlantic employee, we're there on
24 behalf of CLEC A, CLEC B.

25 Of course, there's been some orientation and

1 training of the repair folks for that eventuality. For the
2 repair attendants, because of the need, as to receive a call
3 from the end user, to recognize that not all of the calls
4 that will come into the center in the wholesale arrangement
5 will be from the Bell Atlantic end user, may, in fact, be
6 from the CLEC end user. There has been some training and
7 orientation required, even for the inside attendant.

8 We had considered the velcro patch for the badge
9 and for the trucks, but we went beyond that.

10 MR. WELCH: Okay, i think now we have an
11 opportunity if there's anybody in the audience who'd like to
12 pose some questions to the panelist. Please identify
13 yourself and direct your question to a particular panelist,
14 if you would, please?

15 MS. DALTON: Good afternoon, Nancy Dalton with
16 AT&T. My question is for Mr. Swan. Mr. Swan, in your
17 opening remarks, you reference the LMO system that's used in
18 Bell Atlantic today for repair and maintenance capabilities
19 for POTS services and WFA is used for your design services.

20 If a CLEC is to create a POT service, purchasing
21 an unbundled loop and switch port from Bell Atlantic, which
22 of those systems will be used to provide the OSS
23 capabilities for repair and maintenance?

24 MR. SWAN: I may have to take -- I don't know the
25 exact answer to that. I believe that the way that we've

1 established with in our systems the components for the
2 unbundled or platform service, that they would exist within
3 the LMO system.

4 MS. DALTON: I believe that was the case for Bell
5 South, as well, with the TAFI capabilities, is that right?

6 MS. CALHOUN: Yes, our TAFI system is being
7 taught, if you will, to recognize that a recombination of
8 unbundled elements that replicates a retail exchange service
9 is, for all intents and purposes, a retail exchange service,
10 or, excuse me, a resold exchange service for repair
11 purposes.

12 So, yes, it would appear as an exchange service
13 and would be handled in LMOs.

14 MS. DALTON: So, then, parities being treated
15 from, looking at the view of like services being treated
16 equally, POT services being treated equally amongst
17 carriers?

18 MS. CALHOUN: Yes.

19 MS. DALTON: Okay, thank you.

20 MR. SWAN: No, no, if I understand the direction
21 of the question, the unbundled element is not directly
22 comparable in terms of how it's put in place, how it's
23 implemented, how it's provisioned and how it's maintained
24 from a facilities standpoint directly to an exchange line,
25 if you will.

1 It's a series of unbundled elements which provide
2 the same functionality and service as a local exchange line,
3 but they're unbundled elements and that's the way that their
4 provision and the way we maintain the facilities and the
5 records.

6 MS. CALHOUN: I would agree with that for Bell
7 South. I would agree with that from the perspective of
8 individual, unbundled elements, but for a recombination of
9 unbundled elements, our TAFI system would translate that as
10 an exchange line.

11 MS. DALTON: I just want to make sure that I
12 understand. If I am buying a series of elements and I'm
13 buying them all from either of your companies and I'm
14 purchasing them to create a POTS service, will I have the
15 same capabilities for repair and maintenance as you each
16 have with respect to servicing your POTS services? If I
17 understood correctly, I'll have those capabilities through
18 TAFI for POT services, just as Bell South provides to
19 itself.

20 I'm not sure, based upon the last clarification,
21 if a CLEC would have those same POTS capabilities through
22 LMOs, regardless of whether it's created the service through
23 unbundled network elements or not?

24 MR. SWAN: The distinction I was trying to make,
25 and I apologize if I made it awkwardly, is that we view the

1 platform again as a series of distinct, unbundled elements,
2 which, though ordered separately, provisioned separately,
3 provide in terms of service functionality, the same as basic
4 local exchange service.

5 Now, because they're ordered separately as
6 separate Unbundled Network Elements, we provision them and
7 maintain records and facilities on them as separate
8 elements. They would occur within LMOs as those separate
9 elements.

10 The way that we would seek to complete trouble
11 analysis and reporting may be more akin, if I could use that
12 term, to the way we manage unbundled loops as opposed to
13 regular POTS service. We're still working out those
14 specific details.

15 MS. DALTON: Thank you.

16 MS. STROMBOTNY: I'm Tracy Strombotny with LCI.
17 It sounds like from listening to people here that we're not
18 alone in suffering disconnects during the provisioning
19 process, and I'd like to know how Bell Atlantic and Bell
20 South, how your trouble systems handle those disconnects,
21 because in many cases, as the provisioning process is not
22 complete, we're not the customer of record. And, so, we
23 have a hard time getting those problems resolved, and yet
24 our customer is out of service.

25 So, I'd like to know how your systems handle that?

1 MS. CALHOUN: First of all, let me make sure I
2 understand your question. Are you talking about a customer
3 whose exchange service is being changed to something that
4 would involve an unbundled loop, or are you talking about a
5 migration of a --

6 MS. STROMBOTNY: In assume as is resale situation.

7 MS. CALHOUN: In assume as is resale situation?
8 The way Bell South is provisioning an assume as is resale,
9 the disconnect should not occur.

10 MS. STROMBOTNY: I understand it shouldn't, but it
11 does, so that's why I'm asking. We've encountered this
12 problem with every ILEC that we've dealt with, Bell South
13 included.

14 MS. CALHOUN: Again, if it's a situation where
15 you're assuming it as is and there's no work required, the
16 way our processes are set up, that should not be happening.
17 Now, if you have some other ordering scenario that's
18 occurring that's causing that, I don't know.

19 From a repair perspective, there is a time period
20 following issuance of a service order, where it's a
21 provisioning question versus a maintenance question. But,
22 in general, there is a single point of contact set up. We
23 have an access customer advocacy center is what it has
24 historically been called, and there is a center assigned to
25 support CLECs, and that would be a point of resolution,

1 single point of resolution for troubles associated with
2 either provisioning or repair.

3 MS. STROMBOTNY: Is this the same, then, as would
4 be experienced by a Bell South end customer? Is that the
5 same group or the same service that would be provided when
6 you were trying to assume a customer or get a customer
7 turned up?

8 MS. CALHOUN: In terms of whether it's considered
9 provisioning or maintenance?

10 MS. STROMBOTNY: Mm-hmm.

11 MS. CALHOUN: Yes.

12 MR. SWAN: From a Bell Atlantic standpoint on the
13 question with the as is migration, again, no work required,
14 no physical work required and no switchwork required, it's
15 record exchange, and there would be no need for the service
16 to be interrupted.

17 In the resale migrations that we've completed to
18 date, I'm not aware of any difficulty where we have
19 inadvertently disconnected or disrupted any user service.

20 MR. BRADBURY: Hi, Jay Bradbury with AT&T. Hi,
21 Gloria. You and I have been talking about this subject
22 since August of 1995. TAFI and EDI as they are today kind
23 of bring each half a loaf to the table. You know, AT&T has
24 a strong desire, just like Mr. Welborn discussed there for
25 system integration.

1 The EDI interfaces existent in Bell South today
2 has the mapping there for the access circuits that are used,
3 but if you send a local over on it, it doesn't automatically
4 give you back anything, because it's not mapped.

5 TAFI, on the other hand, is a human to machine
6 interface. We talked some time ago and I've been talking
7 with many people in Bell South about marrying those two up
8 together, putting TAFI, if you would, behind the EDI
9 interface, to get the advantage of the standards and all of
10 the system's expertise that exists in TAFI.

11 Has anything happened since last April on that?

12 MS. CALHOUN: Bell South has provided non-
13 discriminatory access to its TAFI system by making
14 information and functions available to CLECs in
15 substantially the same time and manner we have available for
16 our retail customers. And, we've made that functionality
17 available to AT&T in exactly the same way we have it
18 available for ourselves.

19 The trouble reporting gateway or the electronic
20 bonding gateway has been available for use by our exchange
21 carriers, such as AT&T, for the last couple of years, and
22 when Bell South implemented that gateway, we agreed there
23 were standards for an interface to what we call WFA, what
24 Bell Atlantic calls WFA for design services and there were
25 standards available for an interface to LMOs. And, our

1 implementation agreement at that time was that we would only
2 implement the WFA aspects of that, and we have agreed with
3 AT&T that by December of 1997, we will go and build out the
4 LMOs side of that electronic bonding interface, but we will
5 do it in such a way that it meets the existing standards for
6 the LMOs functionality in that interface.

7 TAFI is something that, frankly, is far above and
8 beyond what the current industry standards for trouble
9 reporting in the access world provide for, and at this
10 point, we have said that we have made full TAFI
11 functionality available. We have agreed to build out the
12 full functionality through the electronic bonding gateway
13 that currently is supported by industry standards, and what
14 we've not agreed to do is to replicate all of the TAFI
15 functionality in the electronic bonding arrangement, because
16 that would render it a non-standard interface.

17 So, what we've done is agree to provide a totally
18 standard interface, and to provide all of the functionality
19 for TAFI as currently available that's sitting today, ready
20 and waiting to be used.

21 MR. SWAN: I can say without hesitation, that
22 nothing has happened in Bell Atlantic on that issue.

23 MR. WELCH: Any other questions from the audience?

24 MR. CLUBFELD: Hank Clubfeld from SAIC. Gloria
25 mentioned a security check, which I think is an excellent

1 approach. I was wondering if the panel had a chance to read
2 on the FCC's Web page, on the Office of Engineering
3 Technology on Damrick the planning for operations support
4 interfaces that looks at the functionality of a gateway, the
5 need to address security, given the fact that these are
6 sensitive operation systems that need petition to make
7 certain that the CLEC is the right CLEC for that party, and
8 that the bad guys don't get in looking like the CLEC.

9 Would you care to comment on that, particularly
10 with respect to the discussion for the particular OSSs that
11 each of you are trying to get addressed?

12 MS. CALHOUN: Well, I can say that Bell South has
13 participated in the development of the document that you're
14 talking about and that we have stayed abreast of it and
15 consider it in our planning and development efforts.

16 MR. SWAN: As has Bell Atlantic. In preparation
17 for the panel periods, we spent some time in conversation
18 with the Bell Atlantic representative from Bell Corp. on
19 that effort.

20 And, security has been a primary focus at each
21 point in our electronic interfaces to OSS functions, both
22 through the gateway and through -- although not to the, with
23 the same approach, even with our electronic bonding
24 initiative.

25 We do that from a far wall standpoint, and then

1 actually when we get to the target operating support system
2 database, for further security checks at the individual data
3 customer level.

4 MR. WELCH: Well, I think that concludes this
5 panel. I want to thank our panelists, Rod Cox, Bob Welborn,
6 David Swan and Gloria Calhoun, for being with us.

7 I'd like to thank all the panelists over the last
8 two days who went out of their way to come and join us and
9 offer their views. It helped the FCC understand the issues.
10 I hoped it helped the people in the industry understand the
11 issues, and I will spare you any more baseball metaphors and
12 just say, we're done. Thank you.

13 (Whereupon, at 1:00 p.m., the hearing was
14 concluded.)
